

Hybrid Retrieval and Reciprocal Rank Fusion

测试查询：D e n s e 与 B M 2 5 的结果怎样组合？

Dense retrieval finds semantic vector similarity. Sparse BM25 retrieval preserves exact keyword and identifier matches.

Reciprocal rank fusion (RRF) combines their ranked lists without assuming that vector distance and BM25 score share a numeric scale. For each candidate, RRF adds $1 / (k + \text{rank})$ from every route.

The fused Top-M candidates can then be reranked before Top-K results are returned with source citations.
